1 April 2023

TO WHOM IT MAY CONCERN

This to certify that I, the below signed, have, on this day, 1 April 2023, examined from head to toe:

- **“Calisto” , a 4 year-old intact female GSD, weighing 25kg. She presented with a high-stepping gait on the hindquarters which is mild and intermittent. On clinical examination, she appears healthy with no pain or crepitus on palpation of her limbs. Her gait is due to her conformation. Sadly, some GSD lines are bred specifically to have steeper angulation of the hindquarters. We see slanting lower backs and knees that are closer to the ground. This is not hindering her in any way at this point from what I can see. However, these dogs are prone to degenerative joint conditions later on life. A holistic approach includes a good quality diet, appropriate physical activity and rest when indicated. I have dispensed some anti-inflammatory medication to be used as Calisto needs.**
- **“Sasha” , an 8 year-old intact female GSD, weighing 27.5kg. She presented with a small focal area of non-pruritic alopecia and mild erythema dorsal to her RHS flank. There is no sign of**

ulceration, bleeding nor infection. It is difficult to pinpoint a definitive diagnosis as the lesion appears to be resolving. I have treated with an anti-inflammatory to minimize any residual inflammation, Nexguard spectra to rule out possible ectoparasites as well as F10 ointment as an antiseptic barrier ointment.

Both dogs were in excellent condition

Should you have any concerns or queries, please feel free to contact me.

Yours faithfully,

B.V.Sc
