RE: ALBINO RABBIT WITH WOUND ON THE EYE @ 50 THE AVENUE, GARDENS,
JOHANNESBURG 2193

To whom it may concern,

Our Pets Pet store brought an albino rabbit for consultation. Upon examination the following was noted: wound on medial canthus of the left eye, small fissures around the left eye with mild ocular discharge. The fur around the eye was soiled with gunge.

Both eyes were cleaned and inspected. The wound above the eye was cleaned with hibitane antiseptic. Open wound treatment was implemented. An oral antibiotic was administered and chloramex ointment was applied on the wounds.

The following was dispensed for management at home.

1. Enrovet 10% Oral solution (Oral antibiotic)
2. Chloramex Eye Ointment (External antibiotic treatment)

The owner was advised to administer the medication as instructed. A follow-up will be done with the owner and Rabbit in 2 weeks' time to assess the wound.

If there is any questions or queries, please feel free to contact us at info@ptnvet.co.za or 011 447 2517.

Kind regards,

Dr D.S Chipere (DVM)
