Age or Date of Birth:	3 years 9 months 14 days / 10-12-2020
Microchip:	
Weight:	59.8kg
Vaccination Date:	
Other Identifying marks:	

To whom it may concern,

Simba was seen for a consultation at TAH Bellville on 24 September 2024.

At the time of examination, Simba appeared to be in general good health, with no obvious abnormalities other than being underweight. The patient had a normal physical exam (normal temperature, heart rate etc.) upon examination today. Dewormer and ectoparasite prevention/treatment was dispensed today. According to the history from the client, the patient was vaccinated 2 months ago and is fed Montego Classic pellets as his primary diet. It was advised to feed the patient for a target body weight of 65kg according to the packaging of the diet. Should the weight not increase with targeted feeding, we recommended the patient come in for further advanced diagnostic testing.

Warm regards,
